

WEEKLY-ONLY VALIDATION MODE

Weekly Purple Touch Visual Audit Guide

Valid, invalid, and boundary examples for Step 1, Latest Scan Candidates, Entry Alerts, and Exit Alerts

Purpose
Use this guide to compare Krishna's chart interpretation with the exact rules currently executed by the application. A PASS drawing means the illustrated rule passes; it does not promise a trade result or place an order.

Scope	Current behavior
Live scan	Weekly only. Monthly and Daily live scans are paused.
Required candles	Weekly touch + Monthly confirmation + 30-minute early/exit + 2-hour final.
History	Existing Monthly and Daily rows remain stored but are not newly scanned or exit-monitored while paused.
Version	Documents behavior implemented as of 06 Sep 2026.

Color key

Color	Technical
Purple	EMA9
Blue	Upper Chande Kroll line
Yellow	Lower Chande Kroll line
Brown	VWMA20
Light green	EMA26
Black	EMA89

1 Weekly data path and decision order

Every Weekly live run refreshes and analyzes four supporting candle streams. The stages are sequential for a candidate; entry and exit checks use separate timeframes.

Order	Gate	Pass requirement	If it fails
1	Step 1	Latest Weekly range intersects or comes within the 3.00% purple EMA9 zone.	No Step 1 row.
2	Strict candidate	All mandatory Weekly/Monthly trend and direction checks pass.	Row stays Step 1 only.
3	Entry snapshot	Candle 2 exists, setup is active, and entry technicals pass.	Candidate may remain waiting or be discarded.
4	Alert gate	NSE market hours, or Force enabled; no duplicate lifecycle row.	No new trade ID or Telegram event.
5	Exit	Latest 30-minute candle closes strictly below yellow.	Matching Weekly trade remains open.

Counts do not tally stage-for-stage

Step 1 is the widest shortlist. Latest Scan Candidates is a stricter subset. Entry Alert History contains deduplicated historical events, not the current candidate count. Exit Alerts apply only to open Weekly trade IDs.

Minimum history used by the code

Check	Minimum / practical requirement	Why
Step 1	9 Weekly candles	Enough to calculate purple EMA9.
Strict Weekly	Effectively 89 Weekly candles	Configured minimum is 52, but black EMA89 is mandatory and unavailable before 89.
Monthly confirmation	At least 19 Monthly candles	Chande Kroll blue needs ATR10 plus stop-period history.
Early/final/exit	At least 30 candles on each entry/exit timeframe	The snapshot functions return insufficient before 30.

2 Step 1: valid Weekly purple-touch shapes

Implemented test: $\text{low} \leq \text{EMA9} \times 1.03$ AND $\text{high} \geq \text{EMA9} \times 0.97$. The displayed range distance is zero when EMA9 is inside the candle range; otherwise it is the nearest wick-edge distance.

Exact range touch

PASS 0.00%

Purple EMA9 lies inside the latest Weekly high/low range. Wick contact is enough; the close does not need to equal purple.

Near touch above purple

PASS 2.00%

The latest low is 2.00% above EMA9. It passes because the allowed range-distance zone is at most 3.00%.

Near touch below purple

PASS 2.00%

The latest high is 2.00% below EMA9. Near-touch acceptance is symmetrical above and below purple.

Body far, wick touches

PASS 0.00%

A Weekly wick that reaches the EMA9 makes range distance 0.00%, even when the candle body and close are farther away.

Important

Step 1 is deliberately broad. Black EMA89, EMA26, blue/purple direction, Monthly confirmation, market structure, and entry readiness are displayed beside the row but do not decide whether the Step 1 row exists.

3 Step 1: invalid and exact boundary cases

Displayed distance	Included in Step 1?	Meaning
0.00%	Yes	EMA9 physically lies inside the Weekly high/low range.
0.01% to 3.00%	Yes	No physical touch, but nearest wick edge is inside the audit zone.
> 3.00%	No	Outside configured Step 1 zone.
Close distance	Not used for Step 1	Shown as context only; range distance controls inclusion.

4 Latest Scan Candidates: mandatory gate sequence

A Latest Scan Candidate is a strict Weekly setup. It may still show Early = wait and Final = wait. Candidate does not mean a new Entry Alert.

Mandatory check	Exact implemented boundary	Result when false/unavailable
Weekly touch	Range-distance zone <= 3.00%	No strict candidate
Blue vs purple	Blue > purple; equality fails	No strict candidate
Approach	Prior close >= 97% of current blue AND latest moves toward/within 3% of purple	No strict candidate
Monthly confirmation	Latest Monthly open > blue OR close > blue; equality fails	No strict candidate
Close vs EMA26	Close >= EMA26; equality passes	No strict candidate
Close vs EMA89	Close > EMA89; equality fails	No strict candidate
Structure	Only explicit downtrend blocks	No strict candidate

5 Latest Scan Candidates: common blockers

Blue equals purple

BLOCK

Blue must be strictly above purple. Equality does not pass.

No blue-to-purple approach

BLOCK

The latest candle may be near purple, but no prior close in the 2-3 candle window came from at least 97% of the blue-line area.

Close below EMA26

BLOCK

The touch can pass, but latest Weekly close below EMA26 blocks strict qualification.

Close equals EMA89

BLOCK

Black EMA89 is strict: close must be greater than EMA89. Equality fails.

Data blocker

Although strict scan configuration says 52 Weekly candles, black EMA89 is mandatory. With 52-88 Weekly candles EMA89 is unavailable, so no Latest Scan Candidate is returned.

6 Strict boundaries and non-blocking context

Monthly open above blue

PASS

Weekly confirmation passes when Monthly open > Monthly blue, even if Monthly close finishes below blue.

Monthly close equals blue

BLOCK

Open and close must not both be at/below blue. Equality alone is not above.

Weekly close equals EMA26

PASS

EMA26 uses $\geq$, so close exactly at EMA26 passes this mandatory check.

EMA9 not above EMA26

PASS WITH WARNING

Purple EMA9 > EMA26 improves score but is not mandatory. The row may still qualify if latest close $\geq$ EMA26 and every mandatory gate passes.

Context shown in UI	Mandatory?	Current effect
EMA9 above EMA26	No	Adds score when true; warning when false.
Yellow below EMA26	No	Adds score when true; warning when false.
Brown VWMA20 vs EMA26	No	Descriptive context only at strict stage.
RSI bullish divergence	No	Entry quality context only.
Close above blue	No	Rare/stronger context only.
Ichimoku, VWAP, Donchian	Ignored	Not used by this Purple Touch setup.

7 Entry lifecycle: mapping C1, C2, and C3 onward

Candle 1 only

WAIT

C1 is the last entry-timeframe candle in the same ISO week whose range maps to the Weekly purple zone. No entry is allowed until C2 closes.

Candle 2 closed

VALID WINDOW

After C2 closes, the invalidation level is the lower of C1 and C2 lows: $\min(98, 99) = 98$.

C3 low equals reference low

STILL VALID

Invalidation uses $\text{low} < \text{reference low}$. Equality does not discard the setup.

Any C3+ low breaks reference

DISCARDED

Every candle from C3 onward is checked. The first low below $\min(C1, C2)$ permanently discards that mapped setup; there is no 10-candle expiry.

Audit point for Krishna

C1/C2 are mapped separately on 30-minute and 2-hour candles, using the Weekly touch timestamp and Weekly EMA9 zone. Confirm that this entry-timeframe mapping matches the intended chart interpretation.

8 Weekly Early Entry Alert technicals (30-minute)

Early technicals pass

ENTRY
CANDIDATE

On 30-minute: close > yellow, blue > purple, C2 closed, and no C3+ invalidation. Yellow > brown is optional for Early.

Close equals yellow

WAIT

Entry requires close strictly above yellow. Equality does not create an Early candidate.

Wick above yellow, close below

WAIT

Only the 30-minute close is tested. A wick above yellow is not enough.

Entry blue equals purple

WAIT

The 30-minute blue line must be strictly above its own 30-minute EMA9. Weekly blue/purple passing does not replace this entry-timeframe check.

Early yellow/brown rule

Yellow above brown VWMA20 is optional for Early Entry. It can improve context, but yellow below/equal brown does not block Early when all mandatory rules pass.

9 Weekly Final Entry Alert technicals (2-hour)

Final technicals pass

ENTRY
CANDIDATE

On 2-hour: close > yellow, blue > purple, yellow > brown, C2 closed, and setup not invalidated.

Yellow equals brown

WAIT

Final requires yellow strictly above brown VWMA20. Equality fails.

Close above yellow; yellow below brown

WAIT

A 2-hour close above yellow is not enough for Final while yellow remains below brown.

Bullish RSI divergence absent

CAN PASS

RSI divergence is optional quality context. Its absence does not block Early or Final entry.

Rule	Early 30-minute	Final 2-hour
C2 closed / no C3+ invalidation	Mandatory	Mandatory
Close > yellow	Mandatory	Mandatory
Blue > purple EMA9	Mandatory	Mandatory
Yellow > brown VWMA20	Optional	Mandatory
RSI bullish divergence	Optional	Optional
Close > blue	Optional stronger context	Optional stronger context

10 From entry candidate to a new Entry Alert

A technical entry candidate becomes a stored alert only after operational gates pass. This is why a row can show entry_candidate while Entry Alert History does not increase.

Situation	New alert?	Implemented result
Market closed; Force off	No	Analysis rows update, but trade IDs, entry/exit events, and Telegram are skipped.
Market closed; Force on	Possible	Cached-data test may create lifecycle rows and optionally Telegram alerts.
Same symbol/profile/kind/touch already recorded	No	Duplicate is suppressed even when the earlier lifecycle is closed.
Final already recorded for same setup	No later Early	Final suppresses a later Early for the same mapped touch.
Early exists, Final appears later	Yes	Early may remain open while a separate Final lifecycle is created.
Early and Final first appear in same run	Final only	Final is evaluated first; its creation suppresses the subsequent Early.
Telegram disabled/unconfigured	Web alert may still exist	Persistence and Telegram delivery are separate.

Weekly maximum open lifecycle

For one stock in Weekly-only mode, at most one Early and one Final Weekly trade can be open. A new mapped touch cannot open another trade of the same kind while that kind is already open.

11 Weekly Exit Alert technicals (30-minute)

30-minute close below yellowEXIT ALERT

A candlestick chart with three bars. The first bar is green, the second is red, and the third is red with its close below a horizontal yellow line. A red label 'close below' points to the close of the third bar. A legend shows a yellow line labeled 'Yellow'.

Latest 30-minute close < yellow triggers exit for each matching open Weekly trade ID.

Close equals yellowOPEN

A candlestick chart with three bars. The first bar is green, the second is red, and the third is red with its close exactly on a horizontal yellow line. A green label 'equal' points to the close of the third bar. A legend shows a yellow line labeled 'Yellow'.

Exit comparison is strict. Equality does not trigger an exit.

Wick below; close aboveOPEN

A candlestick chart with three bars. The first bar is green, the second is red, and the third is red with its wick below a horizontal yellow line but its close above it. A green label 'wick only' points to the wick of the third bar. A legend shows a yellow line labeled 'Yellow'.

A wick below yellow is ignored. The 30-minute candle must close below yellow.

No open Weekly trade IDNO ALERT

A candlestick chart with three bars. The first bar is green, the second is red, and the third is red. A horizontal yellow line is present, but no trade ID is shown. A legend shows a yellow line labeled 'Yellow'.

The exit technical may be true, but exit scanning applies only to existing open Weekly lifecycle rows.

Paused-profile behavior

Existing Monthly and Daily open trades are preserved but not exit-monitored while Weekly-only validation mode is active. Re-enabling those profiles must also resume their own exit scans.

12 End-to-end examples: where a stock should appear

UI section	What one row means	Must be a subset of
Step 1	Current Weekly touch/near-touch audit row	Analyzed Weekly symbols
Latest Scan Candidates	Current strict Weekly setup, entry may be waiting	Current Step 1 rows
Entry Alert History	Deduplicated historical alert event with trade ID	Not a direct subset of current candidates
Exit Alerts	Historical close event for a matching open trade ID	Historical Entry Alerts

13 Audit checklist for a real Weekly stock

Use one stock at a time and record the values below from the UI and Krishna's chart. A disagreement in the first failing row identifies the rule to revisit.

Stage	Record from chart/UI	Expected decision
Weekly Step 1	Latest Weekly H/L, purple EMA9, range distance, Weekly candle count	Distance $\leq$ 3.00%; at least 9 Weekly candles
Weekly direction	Blue, purple, prior 2-3 Weekly closes, latest Weekly close	Blue $>$ purple; prior close reaches 97% blue area; latest moves toward purple
Monthly confirmation	Latest Monthly O/C and Monthly blue	Monthly O $>$ blue OR C $>$ blue
Trend	Weekly close, EMA26, EMA89, structure	Close $\geq$ EMA26; close $>$ EMA89; structure is not downtrend
30-minute lifecycle	Mapped C1/C2 lows and every C3+ low	C2 closed; no C3+ low $<$ min(C1, C2)
Early	30-minute close/yellow/blue/purple	Close $>$ yellow; blue $>$ purple
2-hour lifecycle	Mapped C1/C2 lows and every C3+ low	C2 closed; no C3+ low $<$ min(C1, C2)
Final	2-hour close/yellow/brown/blue/purple	Close $>$ yellow; yellow $>$ brown; blue $>$ purple
Alert gate	Market status, Force, prior touch lifecycle, Telegram toggle	Operational gate passes and event is not duplicate/suppressed
Exit	Open trade ID, latest 30-minute close and yellow	Open trade exists; close $<$ yellow

Best evidence to share

For any unexpected stock, capture the Weekly, Monthly, 30-minute, and 2-hour chart at the same scan timestamp plus its Step 1 and Latest Candidate UI row. Without aligned timestamps, indicator values can legitimately differ.

Implementation trace

Area	Source
Step 1 and strict rules	trading_analysis/analysis/krishna_setup.py
Live profile selection and alert orchestration	trading_analysis/web_services.py
Duplicate and lifecycle precedence	trading_analysis/storage/sqlite.py
Weekly-only controls and progress	web/index.html and web/app.js

14 Points that may need Krishna's confirmation

1. Is a near touch valid?

The implementation includes non-touching Weekly candles up to 3.00% from purple EMA9. Confirm whether Step 1 should remain a 3% audit zone or require a physical wick/range touch for alerts.

2. How should 'approach from blue' be measured?

Current code uses any prior close in the latest 2-3 Weekly candles at or above 97% of the current blue value, plus a latest close moving down or within 3% of purple. Confirm whether candle bodies, highs/lows, or historical blue values should be used instead.

3. Which candles are C1 and C2?

Current code maps C1 and C2 independently inside the 30-minute and 2-hour entry streams. Confirm whether Krishna instead means the first two Weekly candles after the Weekly touch, or another mapping.

4. Should incomplete Weekly/Monthly candles be evaluated?

The scanner uses the latest cached candle. During an active week/month that candle may still be forming. Confirm whether Step 1 and Monthly confirmation should use live incomplete candles, only completed candles, or clearly distinguish both modes.

Review outcome

Decision	Krishna's answer / requested change
Near-touch threshold	
Blue-to-purple approach	
C1/C2 timeframe mapping	
Incomplete candle handling	
Other rule difference	

Document status

This guide describes the current implementation for validation. Update both code and this document after the reviewed definitions are confirmed.
